September 2003

Abstract

This paper examines trends in employment, production, and relative labor productivity in foreign multinational corporations (MNCs) in Indonesian manufacturing and over the last quarter of the 20<sup>th</sup> century. On average, foreign MNCs accounted about one-seventh of employment and a little more than one-fourth of production over this period with relatively low shares observed in 1975 and 1985-1991, and relatively large shares observed after the mid-1990s. There were marked increases in employment and production in the mid- and late-1990s, which were concentrated in the machinery industries and heavily-foreign MNCs, and occurred despite large outflows of foreign direct investments from Indonesia in the late 1990s. Shares of foreign MNCs in production tended to be larger than corresponding shares of employment and correspondingly, value added per worker was higher, often much higher, in foreign MNCs than in local plants. After controlling for plant-wise variation in size and vintage, average labor productivity was significantly higher in foreign MNCs in about one-third of the industry-year combinations examined in 10 selected industries over 26 years. Statistically significant differences were most common in chemicals and electric and precision machinery, and least common in apparel, footwear, and transportation machinery. Significant differences were most common between majority-foreign MNCs and local plants, but differences in labor productivity were rarely significant among foreign ownership groups. Owing partially to examination of a much larger number of industry-year combinations, these results suggest that significant differences of labor productivity between foreign MNCs and local plants may have been less common than suggested by previous studies of Indonesian manufacturing.

---

<sup>1</sup> The authors would like to thank Hal Hill, Robert E. Lipsey, Oleksandr Movshuk, Fredrik Sjöholm, and Wang Wen-Thuen for comments on an earlier paper (Takii and Ramstetter 2000). This paper was completed as a part of ICSEAD's project "Foreign Multinational Corporations and Host-Country Labor Markets in Asia" and the authors are grateful to ICSEAD and Kyushu University for funding that supported the study. All opinions and remaining errors are the responsibility of the authors alone.

## 1. Introduction

Foreign multinational corporations (MNCs) have played an important role in many of Indonesia's manufacturing industries over the last three decades, with employment and production of foreign MNCs, as well as foreign MNC shares of employment and production in Indonesian manufacturing increasing rapidly during the rapid economic growth of the early- and mid-1990s. Moreover, contrary to the impression created by large outflows of foreign direct investment (FDI) after the financial crisis of 1997, foreign MNCs have continued to increase both employment and production after the crisis, both absolutely and relative to Indonesian totals. The first purpose of this paper is to analyze these and other related trends over the last quarter of the 20<sup>th</sup> century, highlighting the large variation in shares of foreign MNCs across time, industry, and foreign ownership group, as well as some of the factors responsible for the observed patterns.

One of the most important contributions of foreign MNCs in developing economies stems from the fact that they are generally expected to possess superior firm-specific assets such as production technology, management know-how, and marketing networks compared to non-MNCs, a group which includes the vast majority of locally owned firms.<sup>2</sup> Consequently, foreign MNCs are generally expected to be more efficient than local firms, and the presence of foreign MNCs is also thought to lead to higher efficiency in local firms, or positive productivity spillovers. Previous studies of foreign MNCs in Indonesian manufacturing (Blomström and Sjöholm 1999; Hill 1988, pp. 107-117, 1990a, 1990b; Sjöholm 1998, 1999a, 1999b, 2000; Takii 2001, 2002) provide evidence that is generally consistent with these expectations. In addition, MNCs are often asserted to restrict the provision of firm-specific assets such as production technology to minority-foreign MNCs, leading to the expectation that productivity may be relatively low in this group of foreign MNCs (Moran 2001), though previous evidence indicates that this may not be the case in Indonesian manufacturing (Blomström and Sjöholm 1999; Takii 2002, Table 5; Takii and Ramstetter 2000). Previous studies of these issues have often assumed almost identical technology across manufacturing industries and focused on relatively short periods of time. Thus, the second major

---

<sup>2</sup> A large body of literature (e.g., Dunning 1988, 1993; Markusen 1991) asserts that the possession of firm-specific assets is a key characteristic of MNCs. Another body of literature (e.g., Buckley and Casson 1992; Casson 1987; Rugman 1980, 1985) disputes this view, asserting that internalization is the key characteristic. However, all agree that MNCs tend to possess these assets in relatively large amounts.

purpose of this study is thus to examine labor productivity differentials at the industry level over a long period of time.

Section 2 examines trends in employment and production of foreign MNCs, and foreign MNC shares of manufacturing employment and value added in Indonesia. Section 3 then compares average labor productivity in foreign MNCs and local plants. In all of these analyses, three ownership groups of foreign MNCs, minority-foreign MNCs with foreign ownership shares of 10 to 49 percent, majority-foreign MNCs with foreign ownership shares of 50 to 89 percent, and heavily-foreign MNCs with foreign ownership shares of 90 percent or more, are distinguished to see if there are important differences among these groups. Finally, section 4 offers some concluding remarks and considers the future research agenda.

## 2. Employment, Value Added, and Market Shares of Foreign Multinationals

As indicated above, employment, value added, and foreign MNC shares of employment and value added increased markedly in Indonesian manufacturing during the 1990s. Employment in foreign MNCs rose from an average of 218,020 in 1985-1991 to 564,930 in 1992-1994, 797,680 in 1996 and 931,160 in 2000 (Table 1). Correspondingly, the share of foreign MNCs in employment of sample plants rose from 10 percent to 16 percent, 19 percent, and 21 percent, respectively (Table 2). Growth rates of value added in foreign MNCs were much faster than the corresponding growth rates for employment, whether measured in current or constant prices, and shares of foreign MNCs in value added of sample plants were always larger than corresponding shares of employment.<sup>3</sup> However, foreign shares of value added increased relatively slowly by comparison, from 23 percent in 1985-1991, to 26 percent in 1992-1994, 31 percent in 1996, and 38 percent in 2000 (Table 3). The increases in foreign shares in the 1990s followed a decline in foreign shares between 1976-1984 and 1985-1991 and foreign shares of value added (but not employment) were actually larger in 1976-1984 than in the early-1990s.<sup>4</sup>

---

<sup>3</sup> Growth rates of employment in foreign MNCs were 159 percent between 1985-1991 and 1992-1994, 41 percent between 1992-1994 and 1996, and 17 percent between 1996 and 2000 while corresponding growth rates of value added in foreign MNCs were 247 percent, 121 percent, and 212 percent, respectively, if measured at current prices and 198 percent, 92 percent, and 61 percent, respectively, if measured at constant prices (Table 1).

<sup>4</sup> Shares were also low in 1975. The choice of periods in tables is based on trends in foreign MNC shares

Before proceeding further, some important characteristics of the data used in this study should be highlighted. The primary data source is a set of plant-level data that underlie Indonesia's industrial surveys which have been conducted annually since 1975 by Indonesia's Biro Pusat Statistik (BPS). These data sets are extremely rich, especially for recent years, making them among the most useful data sets for economic analysis in the developing world, but it is important to keep several characteristics in mind when using the data. First, the surveys cover only plants with 20 or more employees. This is not a large problem in this context because most foreign MNCs are relatively large and it is not generally meaningful to compare relatively large MNCs with small local plants, but this is one reason that the coverage of these surveys is not comprehensive. Second, the coverage of these surveys apparently improved markedly in the 1980s and has generally been better in the 1990s than in previous decades.<sup>5</sup> For example, employment in sample plants averaged only 19 percent of total manufacturing employment in 1976-1984, but this average increased to 33 percent in 1985-1991, and 39 percent in 1992-2000 (Table 1). Corresponding shares of manufacturing value added (GDP) increased from 39 percent to 54 percent and 65 percent, respectively. Third, as the annual detail for 1995-2000 in Table 1 illustrate the coverage of these surveys apparently varied over time in recent years as well, with sample plants accounting for between 37 and 42 percent of manufacturing employment and between 65 and 71 percent of manufacturing value added during this period. Thus, it is important to note changes observed over time in these data can result from changes in survey coverage in addition to changes in economic activity.

Cognizant of coverage problems and several apparently incorrect entries in the original survey compilations, called the raw data sets by BPS, BPS has also compiled separate so-called backcast data sets, which include extensive estimates of missing values for non-reporters as well as revisions of entries that are discovered to have been mistaken in the raw data sets. Unfortunately, there is no backcast available for 2000, and because a major goal of this paper is to examine recent trends, this paper has to rely on compilations from slightly modified versions of the raw data sets.<sup>6</sup> When compiling the raw data sets a

---

which increased markedly in 1976 and fell markedly after 1984 (Appendix Tables 2a-2e, 3a-3e).

<sup>5</sup> One reason for this increase is that larger proportions of plants exceeded the 20 person threshold in recent years, but better sample coverage is probably an important factor as well.

<sup>6</sup> Note that comparisons for 1985-1998 in Takii and Ramstetter (2000) suggest that (1) foreign ownership shares were less slightly volatile and slightly larger in earlier years (e.g., 1985-1989) in compilations from the 1998 backcast than in compilations from the raw data, (2) trends in foreign

number of apparent inconsistencies mistakes in information on foreign ownership shares were found and we attempted to correct these inconsistencies as described in the statistical appendix. Generally speaking adjustments were made when foreign shares for one or two years in the middle of a series greatly differed from estimates for surrounding years. However, no changes were made for post-crisis years (1998-2000) because large changes in ownership during this period made it very difficult to discern actual changes from apparent errors in the data.<sup>7</sup>

If totals for sample foreign MNCs are taken as a ratio of Indonesian manufacturing totals from labor statistics and the national accounts, foreign shares appear to have been much smaller and to have increased more steadily. For example, sample foreign MNCs accounted for 2 percent of all manufacturing employment in 1976-1984, 3 percent in 1985-1991, and 6 percent in 1992-1994, and 7-8 percent thereafter (Table 1). Foreign shares of all manufacturing value added, were 11 percent, 12 percent, 17 percent and 17-27 percent, respectively, with 17 percent recorded in 1997, 27 percent in 2000, and 20-24 percent in 1995-1996 and 1998-1999. It thus seems likely that the in-sample shares may exaggerate the downturn of foreign shares in the late 1980s because survey coverage of foreign MNCs is likely to have been relatively good throughout the sample period whereas coverage of local plants was probably markedly poorer in the late 1970s and early 1980s.

Nonetheless, it should be noted that foreign MNCs were generally not that keen to invest in Indonesia in the early 1980s as illustrated by the fall in the ratio of total FDI stocks in all industries to GDP from 2.6-2.7 percent in 1976-1978 to 1.6-1.7 percent in 1981-1984 (Figure 1). Likewise it is clear that foreign MNCs were much more interested in investing after 1985 until the crisis as the FDI stock-GDP ratio rose from 1.9 percent in 1985 to 4.1 percent in 1991, 8.8 percent in 1996 and a peak of 9.6 percent in the

---

ownership shares differed relatively little among the compilations from both data sets for all foreign ownership groups in all manufacturing industries, but (3) differences in trends in foreign ownership shares were larger in some individual industries. Estimates of average labor productivity differentials were also found to vary little between the data sets.

<sup>7</sup> In addition to these problems, we noticed several other apparent problems (e.g., apparently extreme values of many variables, compared to surrounding years), which we think can and should be corrected in the future but we have not yet had time to make such corrections. These corrections would be extremely time consuming because it would be necessary to check between 7,469-7,962 plants per year in 1975-1984, 12,717-14,676 plants per year in 1985-1989, 16,494-19,017 plants per year in 1990-1994 and 21,423 or more plants per year since 1995. Note that Takii and Ramstetter (2000) also observed similar, though less frequent problems in the 1998 backcast.

crisis year, 1997.<sup>8</sup> Thus, in the 1985-1997 period, trends in overall FDI and trends in employment and value added in manufacturing foreign MNCs were broadly similar, though trends in FDI stocks were more volatile. After the crisis, however, the trends diverge. FDI stocks declined markedly in conjunction with large repatriations of FDI capital by foreign MNCs. This is in marked contrast to the continued rise in employment and value added of foreign MNCs in Indonesian manufacturing, both absolutely and relative to totals for Indonesian manufacturing. Unfortunately, there are no corresponding data on inward FDI by industry in Indonesia so it is impossible to tell how much of the decline in FDI stocks was in the manufacturing sector.<sup>9</sup>

Macroeconomic trends and changes in Indonesian economic policies are clearly related to trends foreign MNC activity over time. As illustrated in Figure 1, Indonesian economic growth slowed in the early 1980s and this is one reason for the decline in FDI flows during this period. A related reason was the stagnation and subsequent fall in oil prices in a period when mineral fuels were still by far the largest Indonesian export.<sup>10</sup> Partially in response to the fall in oil prices and reduced growth, the Indonesian

---

<sup>8</sup> Note that the calculations in Figure 1 assume that FDI flows were converted into rupiah in the year they were remitted. If the opposite assumption is made, that is if it is assumed that FDI flows were never converted into rupiah and kept in U.S. dollar deposits, then converted to rupiah at yearend rates every year, the rupiah value of FDI stocks increases markedly when the rupiah is devalued by large amounts. For example, if this series is used to calculate the FDI stock-GDP ratio, that ratio would rise from 11 percent in 1996 (compared to 9 percent in Figure 1) to 21 percent in 1997 (compared to 10 percent in Figure 1), and 24 percent in 1998 (compared to 6 percent in Figure 1), before declining to 13 percent in 2000; this compares to a rise from 9 percent in 1996 to 10 percent in 1997 in Figure 1, and much faster and steeper decline to 6 percent in 1998 and -2 percent in 2002. It is hard to judge which series is more accurate as a portion of FDI flows was probably converted to rupiah to fund expenditures but another portion was probably held in foreign currency deposits.

<sup>9</sup> For example, home country data indicate that between 1997 and 2000 manufacturing FDI stocks declined US\$110 million for U.S. MNCs (U.S. Bureau of Economic Analysis 2002), but increased US\$176 million for Korean MNCs (The Korean Federation of Banks 1998, The Export-Import Bank of Korea 2000), and US\$274 million for Singapore-based MNCs (US\$81 million for Singapore-controlled MNCs and US\$192 million for foreign-controlled MNCs; Singapore Department of Statistics, various years; International Monetary Fund, various years). In all industries, FDI stocks increased US\$1,785 million in U.S. MNCs, and US\$203 million in Korean MNCs, but decreased US\$815 million in Singaporean MNCs (a decline US\$845 million in foreign-controlled MNCs and an increase of US\$30 million in Singapore-controlled MNCs) and US\$3,140 million in Japanese MNCs (Bank of Japan, various years; International Monetary Fund, various years). This compares to a total net outflow of US\$7,651 million in 1998-2000 as reported by Bank Indonesia (International Monetary Fund various years). In Indonesia there are also data on realized FDI through the Investment Coordinating Board (BKPM) to mid-2000 (Ramstetter 2000) but these data exclude important investments in oil and finance, as well as repatriation of FDI, and cannot be compared with the more standard data cited above.

<sup>10</sup> Mineral fuels accounted for 73 percent or more of total exports in 1980-1984, this share falling to 50 percent in 1987 and then to 28 percent or less in 1993 and subsequent years (International Centre for the Study of East Asian Development, various years).

government undertook some major reforms in 1986, most notably the rationalization and drastic reduction of previously high levels of import protection that often penalized exporters. Subsequently, manufacturing began to grow relatively rapidly, its share of real GDP increasing from 13 percent in 1983 to 21 percent by 1991 and 25 percent by 1996. Then in the early 1990s restrictions on foreign investors were gradually reduced and the 1994 foreign investment law formally removed many previous restrictions on foreign ownership. On top of these reforms economic growth increased to very high levels in the late 1980s and the early- to mid-1990s, which made the investment environment even more attractive. In short, related changes in the business cycle and economic policy were a major factor behind the growth of FDI and foreign MNC activity in the early- and mid-1990s.

These trends were abruptly reversed in 1997-1998 when the Suharto regime crumbled and the financial crisis broke. In late 1997 and 1998, large declines in the value of the rupiah and economic growth and large increases in inflation and political uncertainty in 1998 created great uncertainty among all investors, foreign MNCs included, and led to large outflows of FDI that continued at least through 2002. However, as noted above, foreign MNCs in manufacturing continued to increase production and employment after the crisis, despite these large outflows. This implies that foreign MNCs in manufacturing could have (1) experienced relatively small declines in FDI stocks, (2) reduced the need for corporate finance (equity and loans) by selling off assets not related to production (e.g., financial assets) and repatriating those funds, and/or (3) replaced FDI capital (equity and loans from the parent or related firms abroad) with non-FDI sources such as loans from banks in Indonesia.<sup>11</sup>

One important change, which was a consequence of both the liberalization of restrictions on foreign investors in the early 1990s and the financial crisis in late 1997-1998, was the rapid increase in shares of heavily-foreign MNCs in Indonesian manufacturing. Heavily-foreign MNCs' shares of employment in sample plants increased from averages of 2-3 percent in 1976-1994 to 5-6 percent in 1995-1996, 7-9 percent in 1997-1998, and 10-11 percent in 1999-2000, while corresponding shares of value added increased from 2-5 percent to 6 percent, 10-12 percent, and 15-16 percent, respectively (Tables 2-3).<sup>12</sup>

---

<sup>11</sup> Another possibility is that foreign manufacturing MNCs could have sold off production-related assets and substituted other factors of production (e.g., labor) for those assets in the production process, but the three factors listed in the text were probably more important.

<sup>12</sup> Note that the aggregation in Tables 2-3 of years hides the fact that shares of heavily-foreign MNCs in

Majority-foreign MNCs were the largest ownership group of MNCs in 1976-1997, accounting for a little more than 7 percent of sample employment in most years (1985-1991 was the major exception when this share was 5 percent), and as much as 19 percent of sample value added in 1976-1984, 12 percent in 1985-1996, and 17 percent in 1997. However, the shares of this group fell markedly after the crisis to under 6 percent of employment and 11 percent of value added in 2000. One for the reason for the simultaneous decline in shares of majority-foreign MNCs and increase in shares of heavily-foreign MNCs is the fact that several local joint-venture partners incurred large debts after the financial crisis and were forced to sell their shares in to foreign MNCs. Interestingly, this phenomenon does not seem to have been as widespread in minority-foreign plants, shares of which increased some after the crisis to reach 5 percent of sample employment and 11 percent of value added. These shares were similar to levels minority-foreign plants reached in the early- to mid-1990s, after marked increases between the 1976-1984 and the early 1990s.

The increase in shares of heavily-foreign MNCs was closely related to large increases of production and employment of foreign-MNCs in electric and precision machinery, which became the largest industry of foreign MNC activity in Indonesian manufacturing and dominated by heavily-foreign MNCs in recent years. As late as 1990, foreign MNCs in electric and precision machinery employed only 14,499 workers and produced only 307 billion rupiah in value added, less than 1 percent of total employment and value added in the industry, while heavily-foreign MNCs in the industry employed only 336 workers and produced only 3 billion rupiah in value added (Appendix Tables 2c, 2e, 3c, 3e). By 2000 heavily-foreign MNCs in this industry employed 128,178 workers or half of the industry total and produced 17,726 billion rupiah in value added or 70 percent of the industry total (Tables 1-3). Moreover, the share of this industry total employment and value added of foreign MNCs in manufacturing increased from 5 percent each in 1990 to 18 and 22 percent, respectively, in 2000. Large portions of these increases occurred during and after the financial crisis, and much of the increase in production has been exported. Correspondingly, the combined share of related products in Indonesian exports rose from 1 percent in 1990-1991 to 3-4 percent in

---

value added were also relatively large in 1975-1978, 11-13 percent, before declining to 7 percent in 1979-1980, 5 percent in 1981, and 2-3 percent in 1982-1984 (see Statistical Appendix for details).

1992-1993, 6-8 percent in 1994-1999, and 14-15 percent in 2000-2002.<sup>13</sup> These changes are extremely important and indicate that Indonesia is finally being integrated into the network of foreign MNCs that dominate this industry in Southeast Asia.

Value added of foreign MNCs has also grown extremely rapidly to high levels in two other industries often dominated by foreign MNCs in Asia, transportation machinery and chemicals (Table 1). Foreign MNCs also tended to have relatively large shares of employment and value added in both industries (Tables 2, 3) but they have never employed a large number of workers compared to foreign MNCs in several other industries. Foreign MNCs have always been relatively large in Indonesia's chemicals industry, at least 17 percent of employment and one-quarter of the value added in the industry. Shares of employment were relatively low in 1975 and 1985-1994 while shares of value added were relatively low in 1975 and 1985-1991 and both shares have increased to historically high levels in recent years. Recent increases were particularly large in heavily-foreign plants but majority-foreign plants were larger through 1999 and in terms of value added in 2000. In the transportation machinery industry, foreign MNCs were relatively small through the mid-1980s but their shares grew to relatively high levels by the early-mid 1990s. Heavily-foreign MNCs were virtually nonexistent in the industry in the through the 1980s but their shares increased rapidly in the late 1990s. However, minority-foreign plants remain much larger, especially in terms of value added.<sup>14</sup>

Among the ten individual industries listed in Tables 1-3, foreign MNCs have also tended to have relatively large shares in apparel, footwear, and metal products. In footwear and metal products, shares of foreign MNCs have always tended to be relatively large, but shares were relatively small in apparel until the early 1990s. In footwear and metal products, majority-foreign plants have tended to be the largest group, though shares fluctuated markedly after the crisis and shares of heavily-foreign plants increased conspicuously. In apparel, however, shares of heavily-foreign MNCs were relatively large from the early 1990s, and this group of MNCs accounted for the majority of the increase in MNC activity in the industry.

---

<sup>13</sup> These are the combined shares of office & computing machinery (SITC 75), telecommunications machinery (SITC 76), other electrical machinery (SITC 77), professional and scientific instruments (SITC 87), and photographic and optical equipment (SITC 88); data for 2002 refer to the first nine months of the year (International Centre for the Study of East Asian Development, various years).

<sup>14</sup> There are large fluctuations in the shares of minority- and majority-foreign plants in years surrounding the crisis, probably related to changes in the ownership structure of several large automobile firms after the crisis.

Foreign MNCs in apparel and footwear relatively large numbers of workers in many years, but were much smaller in terms of value added. Foreign MNCs in metal products were relatively small in terms of employment in all years and also in terms of value added until very recently.

In textiles, foreign shares were relatively large through the 1980s and foreign MNCs in this industry have always employed more workers in this industry than in most other industries. However, foreign shares fell markedly in the 1990s as local plants increased production and employment relatively quickly. As in numerous other industries, majority-foreign MNCs have generally been the largest ownership group in textiles, but heavily-foreign MNCs grew the most rapidly in the 1990s. Shares of foreign MNCs as well as production and employment levels all tended to be relatively small in the three other individual industries listed in Tables 1-3, food, rubber, and plastics. In these three industries as well, majority-foreign MNCs tended to be the largest MNC group while heavily-foreign MNCs grew relatively rapidly in rubber and plastics in recent years, becoming the largest group in plastics. In food, however, the shares of heavily-foreign MNCs remained relatively low.

### 3. Comparing Average Labor Productivity in Foreign Multinationals and Local Plants

As observed in the previous section, foreign MNCs' shares of value added tended to exceed corresponding shares of employment for most industry-year combinations examined. This in turn suggests that foreign MNCs tend to have higher value added per employee than local plants in Indonesian manufacturing. Correspondingly, comparisons of value added per worker indicate that this measure of labor productivity was, on average, much higher in all ownership groups of foreign MNCs than in local plants in all manufacturing industries (Table 4). For example, in 1975-2000, average value added per employee was 352 percent higher than in local plants for heavily-foreign plants, 562 percent higher in majority-foreign plants, and 661 percent higher in minority-foreign plants. There was large variation across years and ownership groups, however. For example, in all manufacturing, labor productivity was highest in majority-owned MNCs through 1975-1991 and 1997, but highest in minority-foreign MNCs in 1992-1996 and 1998-2000. Among MNCs it was lowest in heavily-foreign MNCs in 1985-1994, 1996, and 1998-2000, in minority-foreign plants in 1975-1984 and 1997, and in majority-foreign plants in 1995.

However, value added per worker was always smaller in local plants than in all of these foreign MNC groups in all manufacturing.

There is also large variation in productivity differentials across individual industries (Table 4). For example, the differentials between foreign MNCs and local plants tended to be relatively low (an average of less than 200 percent for 1975-2000) in all groups of foreign MNCs in electric and precision machinery and rubber, in minority- and heavily-foreign MNCs in textiles and footwear, and in minority-foreign MNCs alone in apparel. Negative differentials, implying higher labor productivity in local plants, were observed for a few years in a number of industries, for example, food (minority-foreign MNCs in 1975), apparel (minority-foreign plants in 1985-1991 and heavily-foreign plants in 1975-1984), footwear (minority-foreign plants in 1995), rubber (minority-foreign plants in 1995 and 2000, plastics (minority- and heavily-foreign plants in 1975), and transportation machinery (minority- and heavily-foreign plants in 1975). However, even after disaggregation by industry and ownership group, negative differentials were not very common, which is in marked contrast to the Thai case, for example (Ramstetter 2003). In addition, there were a few industries in which heavily-foreign MNCs had lower labor productivity than one or more of the other groups of MNCs in earlier years, but in which heavily-foreign MNCs had the highest labor productivity in recent years (1995-2000), food, apparel, plastics, and electric and precision machinery.<sup>15</sup> Thus, although comparisons for all manufacturing plants do not suggest that heavily-foreign MNCs had relatively high labor productivity, this conclusion is reversed for some industries in recent years.

Comparisons of productivity differentials like those in Tables 4 are an instructive starting point but they suffer an important shortcoming. Namely, they cannot sort out differences in labor productivity that result from the presence of foreign ownership or from plant-wise variation in other factors related to labor productivity such as size, age, and factor intensities. In order to clarify the effects of foreign ownership, it is thus common to estimate equations where labor productivity is a function of the other variables thought to influence labor productivity (e.g., Blomström and Sjöholm 1999; Ramstetter 2003; Takii and Ramstetter 2000), and a set of dummy variables in equations distinguishing foreign MNCs, such as the following:

---

<sup>15</sup> In plastics there is an apparent outlier for heavily-foreign MNCs in 1995, but heavily-foreign MNCs still had the highest labor productivity on average in 1996-2000.

$$(1) \ln(Vt/Et) = a_0 + a_1 * \ln(O) + a_2 * \ln(AGE) + a_3 * DF$$

$$(2) \ln(Vt/Et) = b_0 + b_1 * \ln(O) + b_2 * \ln(AGE) + b_3 * DF_{Hvy} + b_4 * DF_{maj} + b_5 * DF_{min}$$

where variables are measured at the establishment level in a cross section for a given industry and given year and

AGE=year in which the plant first reported positive employment + 1 (AGE<=26),

DF=dummy variable for all foreign plants,

DFhvy=dummy variable for heavily-foreign plants,

DFmaj=dummy variable for majority-foreign plants,

DFmin=dummy variable for minority-foreign plants,

E=employment (persons engaged),

O=output,

V=value added.

The coefficient  $a_3$ , for example, is thus percentage difference in average labor productivity between all foreign MNCs on average and local plants, after accounting for differences in labor productivity caused by variation in plant size and vintage. Likewise coefficients  $b_3$ ,  $b_4$ , and  $b_5$  are the percentage differences in labor productivity between heavily-foreign, majority-foreign, or minority-foreign plants, respectively, and local plants, after accounting for differences in labor productivity caused by variation in plant size and vintage.

The specifications in equations (1) and (2) have several disadvantages and advantages which should be noted. First, the most conspicuous shortcoming is the omission of capital intensity from the set of factors expected to influence labor productivity. However, consistent data on capital are only available for 1988-1995 and a primary goal of this paper is to examine trends from 1975 forward so it is impossible to include this variable. Second, even if capital intensity were included, equations (1) and (2) imply some very restrictive assumptions about technology. Namely the elasticity of substitution between factors is assumed to be one (i.e., Cobb-Douglas technology is assumed) and constant returns to scale are also

assumed. Although these assumptions are clearly unrealistic in many cases, it is very difficult to relax these assumptions and at the same time test for differences among several ownership groups because more flexible functional forms involve a large number of independent variables and that are often highly correlated. This makes it difficult or impossible to obtain efficient estimates and the specifications in equations (1) and (2) make it much easier to avoid this multicollinearity problem. These equations also make it easier to avoid another statistical problem, heteroscedasticity, which is more likely to occur when value added is estimated as a function of employment in levels. Nonetheless, heteroscedasticity is still a problem in a large number of the estimates, and in these cases White's heteroscedasticity-consistent standard errors are used for statistical tests. A final disadvantage of this approach is that sample size sometimes becomes rather small because equations are estimated in single-year cross sections at the industry level. It would thus be possible to improve the efficiency of the estimates by pooling industries or creating panels for several years. However, many of the slope coefficients vary in a large range across years and industries, and are measured with very small standard errors, as indicated by small significance levels (Appendix Tables 5 and 6). Correspondingly, it is not realistic to combine industries and years in many cases.

Equations (1) and (2) are estimated for two samples for each of 10 selected industries and 26 years, a sample of all plants and a sample of the large plants, defined as the largest 25 percent of the plants by output in an industry-year combination. The 10 selected industries are the individual industries listed in Tables 1-4, and they accounted for about three-fourths foreign MNC employment in 1975-2000 and similar proportions of foreign MNC value added in 1989-2000 but smaller shares of foreign MNC value added in earlier years and smaller shares of employment and value added in all sample plants in 1975-2000.<sup>16</sup> Thus, foreign MNCs tended to have a relatively large presence in sample industries compared to other industries. This occurs largely because foreign MNC presence is so scarce that equations (1) and (2) often cannot be estimated for many of the individual industries included in the other industries category. Indeed, even for the 10 selected industries in which foreign MNC presence is relatively large, there are a number of

---

<sup>16</sup> These ten industries accounted for between 71 and 80 percent of foreign MNC employment in 1975-2000 and 69-84 percent of foreign MNC value added in 1989-2000, but 53-67 percent of foreign MNC value added in 1975-1988; shares of all plants were 61-68 percent for employment and 50-68 percent for value added (Appendix Tables 2a-3e).

industry-year combinations for which the equations could not be estimated for large plants because samples were too small (less than 30) or for which there were no foreign MNCs in one or more ownership groups.<sup>17</sup>

The most conspicuous result of these regressions is the fact that coefficients on foreign ownership dummies were statistically insignificant at the standard 5 percent level in most of the industry-year combinations examined. For example, in the sample of all plants, equation (1) was estimated for all 260 industry-year combinations possible (26 years each in all 10 industries) but the coefficient on the foreign ownership dummy was statistically insignificant in 158 or 61 percent of the combinations (Table 5). A very similar result also obtained in the sample of large plants where this coefficient was insignificant in 64 percent of the 238 industry-year combinations for which the equation could be estimated (Table 6). When equation (2) was estimated, coefficients on the dummy for majority-foreign MNCs were insignificant in 59 percent of the 246 cases examined for all plants and 65 percent of the 238 cases examined for large plants. For heavily- and minority-foreign MNCs, insignificant coefficients were even more common, being observed in 72 percent of 229 cases and 76 percent of 241 cases, respectively, in samples of all plants and in 75 percent of 216 cases and 86 percent of 236 cases, respectively, in samples of large plants. Thus, these results suggest that labor productivity was not significantly higher in foreign MNCs for about three-fifths or more of the industry-year combinations examined after the influence of plant size and vintage are removed.

Another important result is that when coefficients on foreign ownership dummies were significant, they were usually positive. Estimates of equation (1), for example, reveal positive and significant coefficients on the foreign ownership dummy in 32 percent of the cases in both samples of all plants and samples of large plants (Tables 5, 6). Significantly negative coefficients were far less common, occurring in 7 percent of the samples of all plants and 4 percent of the samples of large plants. In estimates of equation (2), significantly positive coefficients for majority-foreign MNCs were observed in 35 percent of the samples of all plants and 33 percent of the samples of large plants; significantly negative coefficients were observed for 7 percent and 2 percent of the cases examined, respectively. Significantly positive coefficients were much less common for heavily- and minority-foreign MNCs, occurring 16 percent and 15 percent of the time, respectively, in samples of all plants and 18 percent and 11 percent of the time,

---

<sup>17</sup> There were also a few cases where there were no foreign MNCs in two of the three ownership groups in equation (2), making estimates of equations (1) and (2) identical.

respectively, in samples of large plants. Significantly negative coefficients were also somewhat more common in these groups, occurring in 12 percent and 9 percent, respectively, of the samples of all plants and in 8 percent and 3 percent, respectively, of the samples of large plants.

A third general result of some importance is that equations (1) and (2) generally fit the data quite well for plant-level cross sections such as these, especially in the samples of all plants. For example, the adjusted R-squared was 0.3 or larger in 244 or 94 percent of the industry-year combinations for which equation (1) was estimated in samples of all plants (Table 5). However, this good fit was largely the result of the high explanatory power of the size factor and this threshold was exceeded for only 68 or 29 percent of the industry-year combinations for which the equation could be estimated in samples of large plants (Table 6). Nonetheless, even in the samples of large plants, the adjusted R-squared exceed 0.2 in 147 or 62 percent of the cases examined, which is still a reasonably good fit for cross sections such as these. A related point is that disaggregating foreign MNCs by foreign ownership group rarely improved the fit of the explanatory equation of the model much. The adjusted R-squared was 0.01 points or more higher in equation (2) than in equation (1) in only 9 cases in the samples of all plants and in only 10 cases in samples of large plants. Correspondingly, Wald tests of the hypothesis that coefficients on foreign ownership dummies were the same for all foreign ownership groups ( $H_0: b_3=b_4=b_5$ ) indicate that this hypothesis were rejected at the 5 percent level in less than 18 percent (43 of 242) of the samples of all plants and less than 12 percent (27 of 237) of the samples of large plants for which tests could be performed.

Although differences among ownership groups may not be statistically significant, trends in coefficient size and significance do give some indication of what groups of plants are responsible any observed differences in productivity between foreign MNCs and local plants. Labor productivity differentials favoring foreign MNCs were by far the most common in chemicals, occurring in 24 of 26 years in samples of all plants and in 23 of 26 years in samples of large plants (Table 5, 6). Although the Wald tests reveal significant differences among foreign ownership groups in only a few years (1993, and 1999-2000 in samples of all plants and 1999 in samples of large plants), the results suggest that significantly positive differentials were somewhat less common in minority- and heavily-foreign MNCs. In short, foreign MNCs have always been relatively large in this industry and appear to have had relatively high labor productivity as well, but differences among MNCs have relatively small.

As detailed above, foreign MNC presence also became very large in electric and precision machinery in the 1990s but in this industry the increase in foreign presence has been accompanied by the apparent disappearance of significantly higher labor productivity in foreign MNCs. For example, in samples of all plants, estimates of equations (1) and (2) revealed significantly higher labor productivity in all foreign MNCs, majority-foreign MNCs, and minority-foreign MNCs in 11 of the 12 years from 1979 to 1990 (Table 5), but differences among foreign ownership groups were only significant in 1979-1984 and 1990. However, positive differences were not observed after foreign MNC presence began to grow rapidly in the early 1990s and there were 3-4 years in the mid-1990s when all foreign MNCs and heavily-foreign MNCs had significantly lower labor productivity than local plants. However, here again differences between foreign ownership groups were not statistically significant during this period. In samples of large plants, significant coefficients, both positive and negative, were less common but there was a similar pattern for significantly positive differentials to be common through 1990 with negative differentials observed for a few years in the mid-1990s (Table 6). In large electric and precision machinery plants, significant differences among foreign ownership groups were somewhat more common, occurring in 1979, 1981, 1984, 1994, and 1997.

In samples of all plants, significantly positive coefficients were also relatively common in metal products and plastics for all foreign MNCs and for majority-foreign MNCs,. Wald tests revealed significant differences among foreign ownership groups in 2 years (1985-1986) in metal products and 7 years in plastics (1975-1981). Significantly positive coefficients were less common in samples of large plants and in plastics, there were also a number of years in the 1970s and 1980s where statistically significant negative coefficients were observed for wholly-foreign plants in both samples of all plants and large plants. In food, textiles, and rubber, the pattern contrasted as significantly positive coefficients were relatively common in samples of large plants but less common in samples of all plants. In food and textiles, the significantly positive coefficients were most often observed in majority-foreign MNCs but this was not the case in rubber; in all of these industries significantly positive coefficients were more common in recent years than in earlier years. Significant differences among foreign ownership groups were observed in 5 years in both samples of all and large plants in textiles, but in 3 or fewer years in food and rubber. In the remaining three industries, apparel, footwear, and transportation machinery, significantly positive

coefficients were generally less common than in other industries. There were a number of years where coefficients were significantly negative in apparel, especially for wholly-foreign MNCs, and also a few years with negative coefficients in footwear. Significant differences among foreign ownership groups were also relatively common in apparel (7 of 20 years in samples of all plants, 4 of 20 years in samples of large plants) and all footwear plants (4 of 14 years), but not in large footwear plants (1 of 13 years) or transportation machinery (1 of 26 years in both samples).

The broad patterns observed above suggest that labor productivity has not always been significantly higher in foreign MNCs in Indonesian manufacturing. However, they also suggest that in the cases where significant differences are observed, foreign MNCs tend to have higher labor productivity and that these differences are stronger in majority-foreign MNCs than in the other groups. Conversely, in the relatively few cases where negative differentials are observed, they tend to be most common in wholly-foreign MNCs, but differences among foreign ownership groups are rarely significant statistically. Finally, there is large variation across industries, with significantly positive differentials being most common in chemicals and electric and precision machinery, and least common in apparel, footwear, and transportation machinery.

#### 4. Conclusions and Implications for Past and Future Research

This paper has examined trends in shares of foreign MNCs in Indonesian manufacturing and compared average labor productivity of three groups of foreign MNCs with local plants. First, shares of foreign MNCs were generally smaller in the late 1980s than in other periods and increased rapidly in the mid- and late-1990s. Increases in manufacturing employment and production in foreign MNCs continued after the financial crisis, in marked contrast to large decreases in FDI stocks from 1998 forward. Employment and production of heavily-foreign MNCs in the machinery industries rose at a particularly rapid rate in the mid- to late-1990s. Shares of foreign MNCs in production tended to be larger than corresponding shares of employment and correspondingly, value added per worker was higher, often much higher, in foreign MNCs than in local plants.

More rigorous comparisons among three foreign ownership groups of MNCs (minority-foreign,

majority-foreign, and heavily-foreign) and local plants in 10 selected industries for 26 years, which also control for plant-wise variation in size and vintage, suggests average labor productivity was significantly higher in foreign MNCs in about one-third of the industry-year combinations examined. Significant differences between foreign MNCs were most common in chemicals and electric and precision machinery, and these differences were most common between majority-foreign MNCs and local plants but differences among foreign ownership groups were usually insignificant statistically. Conversely, significant positive differentials in favor of foreign MNCs were least common in apparel, footwear, and transportation machinery. Taken together, these results suggest that significant differences between labor productivity in foreign MNCs and local plants may have been somewhat less common than suggested by previous research on Indonesian manufacturing (e.g., Blomström and Sjöholm 1999; Sjöholm 1998, 1999a, 1999b, 2000; Takii 2002; Takii and Ramstetter 2000) and that differences among foreign ownership groups are not that pervasive. Differences between these results and the results of previous studies obtain partially because this study examines a much larger number of industry-year combinations than previous studies have. However, as emphasized above, the methodology employed in this study is extremely simple and it is possible that using more sophisticated methodologies such as those used in the previous studies mentioned above could generate different results in the same samples. Examination of additional industry-year combinations and closer comparisons of the results obtained with different productivity measures and statistical methodologies would thus be very helpful to clarify the results reported here. Unfortunately, these extensions are possible only for recent years (1988 forward) when data are relatively abundant and samples relatively large.

There are also a number of important data issues that need further consideration. First, there are a number of apparent outliers in the data and it would be particularly helpful to obtain the 2000 backcast to help check which observations are unreasonable outliers and which are meaningful data points. Likewise, the methodology for estimating (in the case of missing observations) or revising (in the case of outliers) data entries (e.g., foreign ownership shares) needs to be reviewed and clarified. Second, even if the 2000 backcast could be obtained, the BPS backcasts include only a very few variables. It would thus be helpful to add other variables to the backcast data sets, for example the number of production workers, wage payments (to all employees and to production workers), fixed capital stocks, and investment in fixed assets,

in addition to making further adjustments to estimates of employment, and redo calculations using the cleaned data sets. The results of Takii and Ramstetter (2000) suggest that using the backcast data sets will not change major qualitative results much, but the backcast data do appear to be more reliable than the raw data used in this study, and further adjustments and additions to the backcast data could make them even more useful in this context. Unfortunately, such work would require a coordinated effort by several researchers for an extended period of time and is beyond our capabilities at this point.

Notes: ns = not significant; "-" = sample size less than 30 or no foreign MNC plants; heteroscedasticity-consistent standard errors are used if White is significant at 0.05 or less; see Appendix Table 6 for details.

## Statistical Appendix

The purpose of this appendix is first to describe how data on foreign ownership were checked and corrected. This is done in the paragraphs below. The second purpose is to present compilations of data underlying the descriptive text Table 1-4 in Appendix Tables 1a-4e. Because these compilations have not been published before, these tables include details by year and industry that are omitted from the text tables to save space. Third, Appendix Tables 5 and 6 present detailed regression results which are summarized in text Tables 5-6.

As described in the text, we corrected a number of apparent inconsistencies in foreign ownership shares in the original data. The most obvious inconsistencies were when the foreign ownership share was recorded as K% for all but one or two years when the share was recorded as 100-K%. Some of these apparent inconsistencies reflect real changes in ownership but most are probably the result of incorrect data entry or recording. To correct these apparent inconsistencies we adjusted the data in the steps listed below. These adjustments affected a total of 453 observations in 705 records.

Step 1. We check for records where the sum of ownership shares for four types of owners (domestic-private, foreign, central government, and local government) did not equal 100 percent. In these cases we replaced the foreign ownership share in year t with the foreign ownership share in year t-1.

Step 2. We checked for records where (1)  $F_t = F_{t+6} > 0$  and  $F_{t+1} = F_{t+2} = F_{t+3} = F_{t+4} = F_{t+5} = 0$ , (2)  $F_t = F_{t+5} > 0$  and  $F_{t+1} = F_{t+2} = F_{t+3} = F_{t+4} = 0$ , or (3)  $F_t = F_{t+4} > 0$  and  $F_{t+1} = F_{t+2} = F_{t+3} = 0$ . In these cases, the zeros in the intervening years were replaced with the values from the years on either end of these series.

Step 3. We checked for the records where (1)  $100 > F_t > 0$ ,  $F_{t+1} = 0$ ,  $F_{t+2} = 0$ ,  $100 > F_{t+3} > 0$ , and (2)

$100 > Ft > 0$ ,  $Ft+1 = 0$ ,  $100 > Ft+2 > 0$ . In these cases we replaced  $Ft+1$  with  $Ft$ , and  $Ft+2$  with  $Ft+3$  in the case of (1).

Step 4. We checked for the records where (1)  $100 > Ft > 0$ ,  $Ft+1 = 100$ ,  $Ft+2 = 100$ ,  $100 > Ft+3 > 0$ , and (2)  $100 > Ft > 0$ ,  $Ft+1 = 100$ ,  $100 > Ft+2 > 0$ . In these cases we replaced  $Ft+1$  with  $Ft$ , and  $Ft+2$  with  $Ft+3$  in the case of (1).

Step 5. We checked for the records where (1)  $100 > Ft > 0$ ,  $Ft+1 = 100$ ,  $Ft+2 = 0$ ,  $100 > Ft+3 > 0$ , and (2)  $100 > Ft > 0$ ,  $Ft+1 = 0$ ,  $Ft+2 = 100$ ,  $100 > Ft+3 > 0$ . In these cases we replaced  $Ft+1$  with  $Ft$  and  $Ft+2$  with  $Ft+3$ .

Step 6. We checked for records where (1)  $Ft = K$ ,  $Ft+1 = 100 - K$  and (2)  $Ft+2 = K$ ,  $Ft+1 = 100 - K$  ( $0 < K < 100$ ) and modified some of these records. For example, in the case that  $Ft = 35$  and  $Ft+1 = 65$ , and  $Ft+2 = \text{approximately } 35$ , we replaced  $Ft+1$  with  $Ft$  in the case of (1), and replaced  $Ft+1$  with  $Ft+2$  in the case of (2).

Step 7: We check for the records where  $100 > Ft > 0$ ,  $Ft+1 = 0$ ,  $Ft+2 = 100$ . In the case, we replaced  $Ft+1$  with  $Ft$ .

Notes: ns = not significant; "-" = sample size less than 30, In(AGE) cannot be calculated, or no foreign MNC plants in this ownership group;  
heteroscedasticity-consistent standard errors are used if White is significant at 0.05 or less;  
the Wald statistic tests the null hypothesis that coefficients on Dfmin, Dfmaj, and DfHvy are equal ( $H_0: b3=b4=b5$ ).

Notes: ns = not significant; "-" = sample size less than 30, In(AGE) cannot be calculated, or no foreign MNC plants in this ownership group; heteroscedasticity-consistent standard errors are used if White is significant at 0.05 or less; the Wald statistic tests the null hypothesis that coefficients on Dfmin, Dfmaj, and DfHvy are equal ( $H_0: b3=b4=b5$ ).
